

Key Findings

- Year on year, 13SURF (in) and Ambo Triple 000 (out) calls have increased to the point where system is under stress and calls have become too time consuming.
- ICEMS will provide faster, more accurate communications from Police to SOC and DOs.
- Information provided will be far broader and to an unprecedented depth eg Customer Service Data (Name, number and address) and AML (Lat/Long, Date and Time of positioning)
- SurfCom architecture is unknown, but it is clear many more fields will need to be added and some standards eg GPS, will need to be altered.
- No material change to SurfCom “skin” once implemented.
- A staged implementation would be preferable to smooth out any issues and minimise disruption to all agencies. EG Stage 1 – NSWPF; Stage 2 – ANSW, Stage 3 - Other Agencies
- NSWPF will require an MOU for initial implementation
- No issues with required VPN for network security and viability.
- Contractor identified who can build ICEMS Engine and Handler (System connections and messaging) for SurfCom
- SLSNSW needs to define its position on whether to invest in an updated SurfCom or move to a new IMS

A Scenario

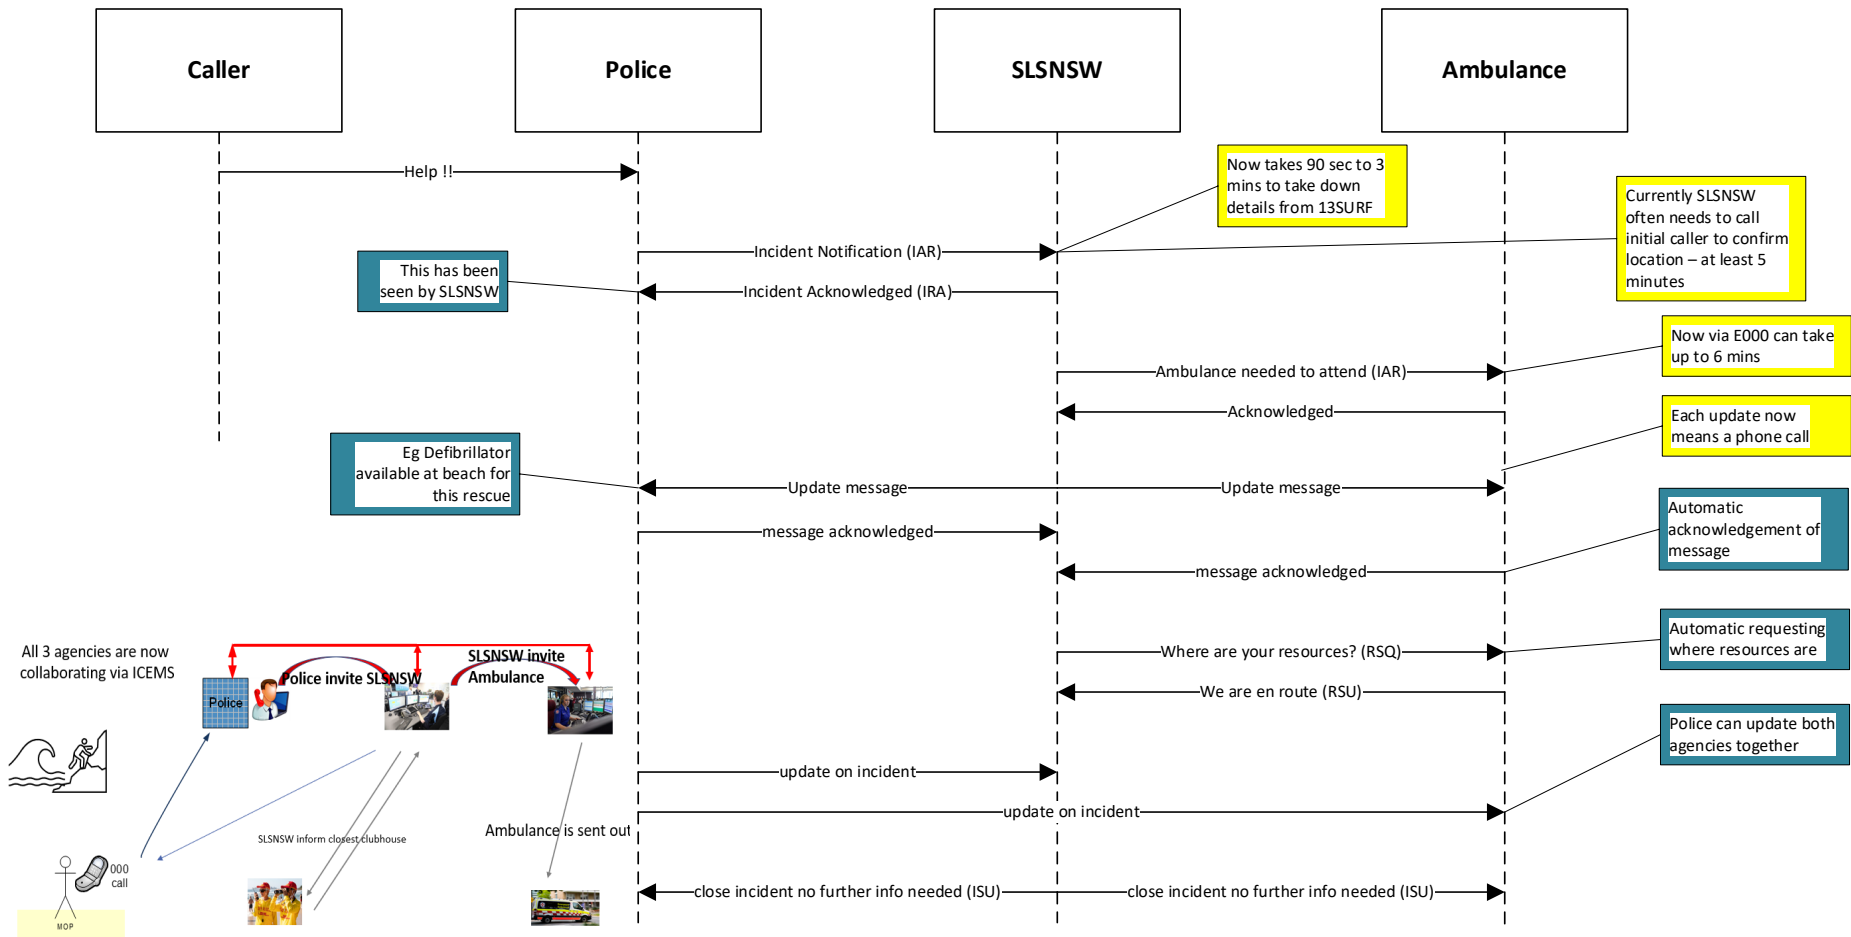

All 3 agencies are now collaborating via ICEMS

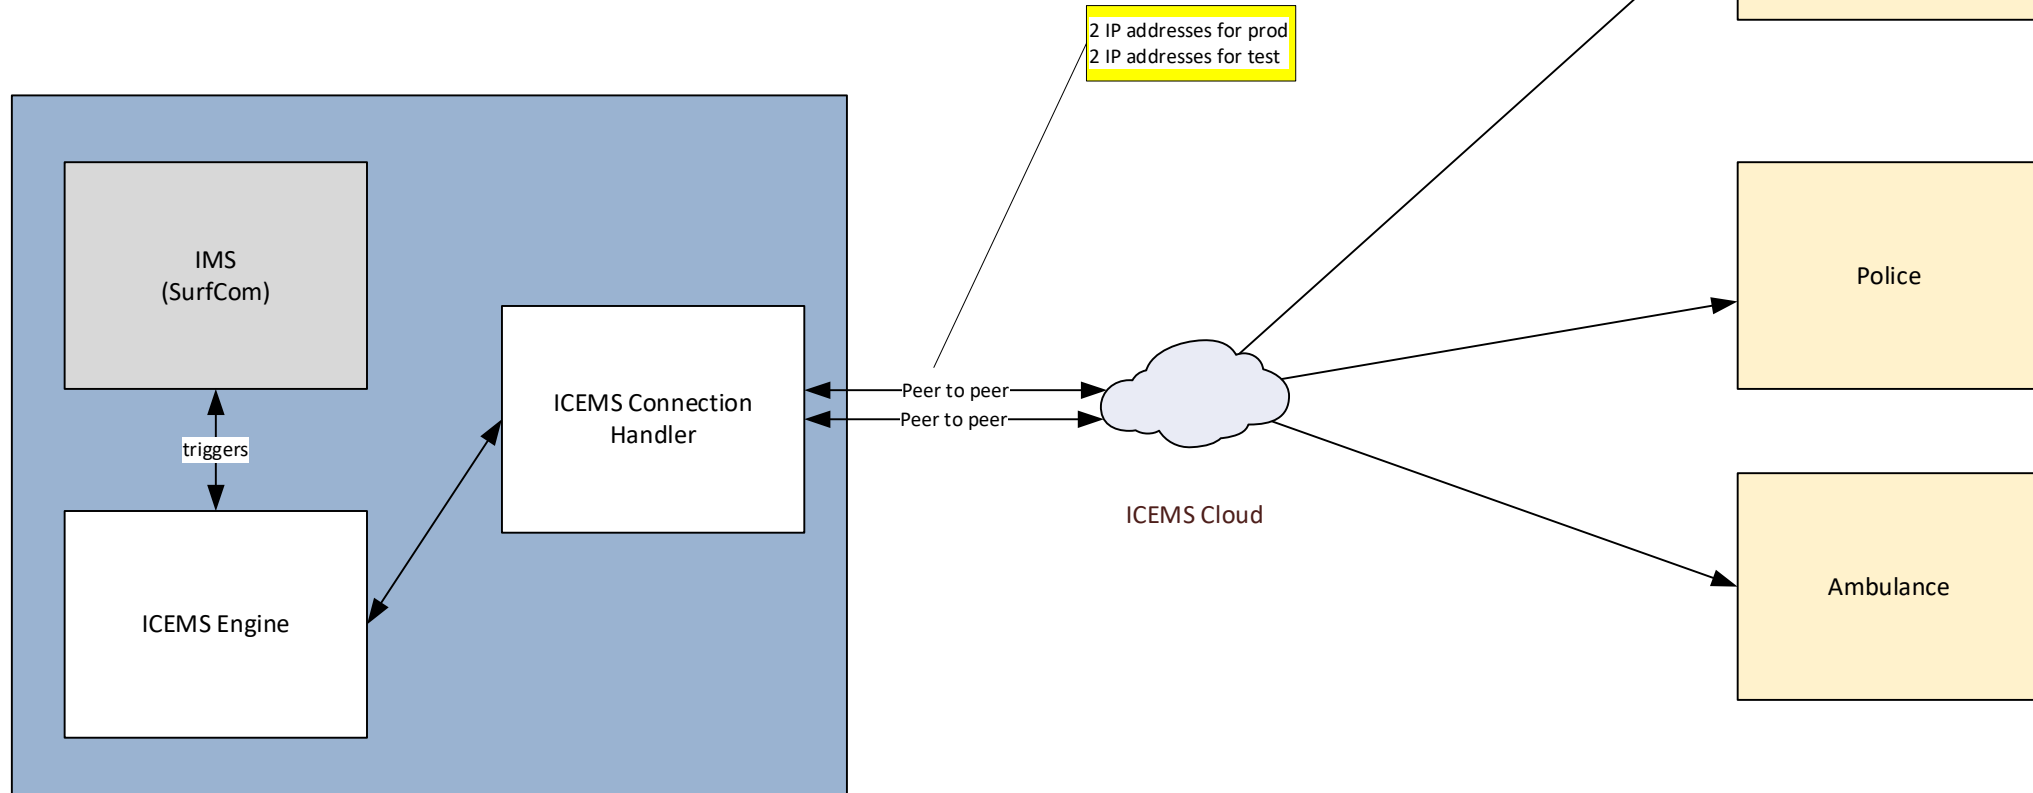

Workflow efficiency gains

Potential time saved

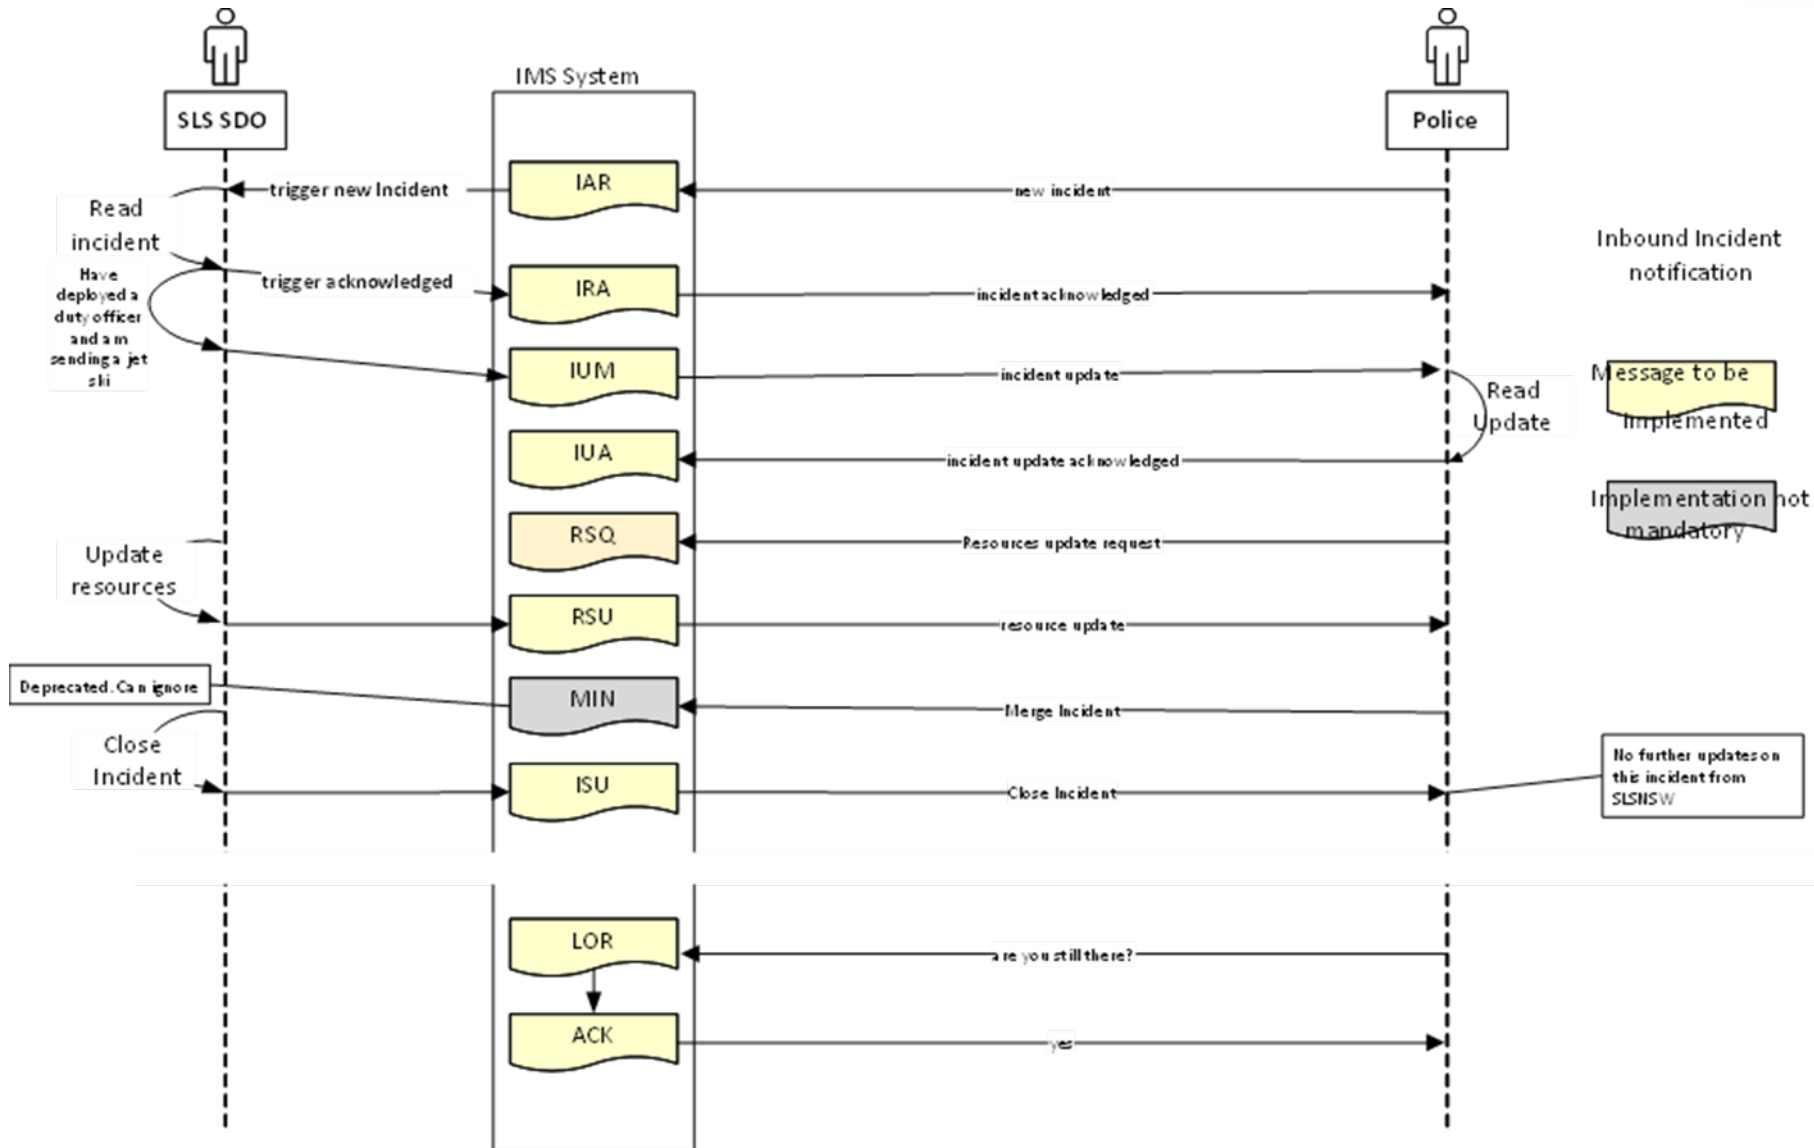

-  3 minutes
-  8 minutes
-  14 minutes
-  17 minutes

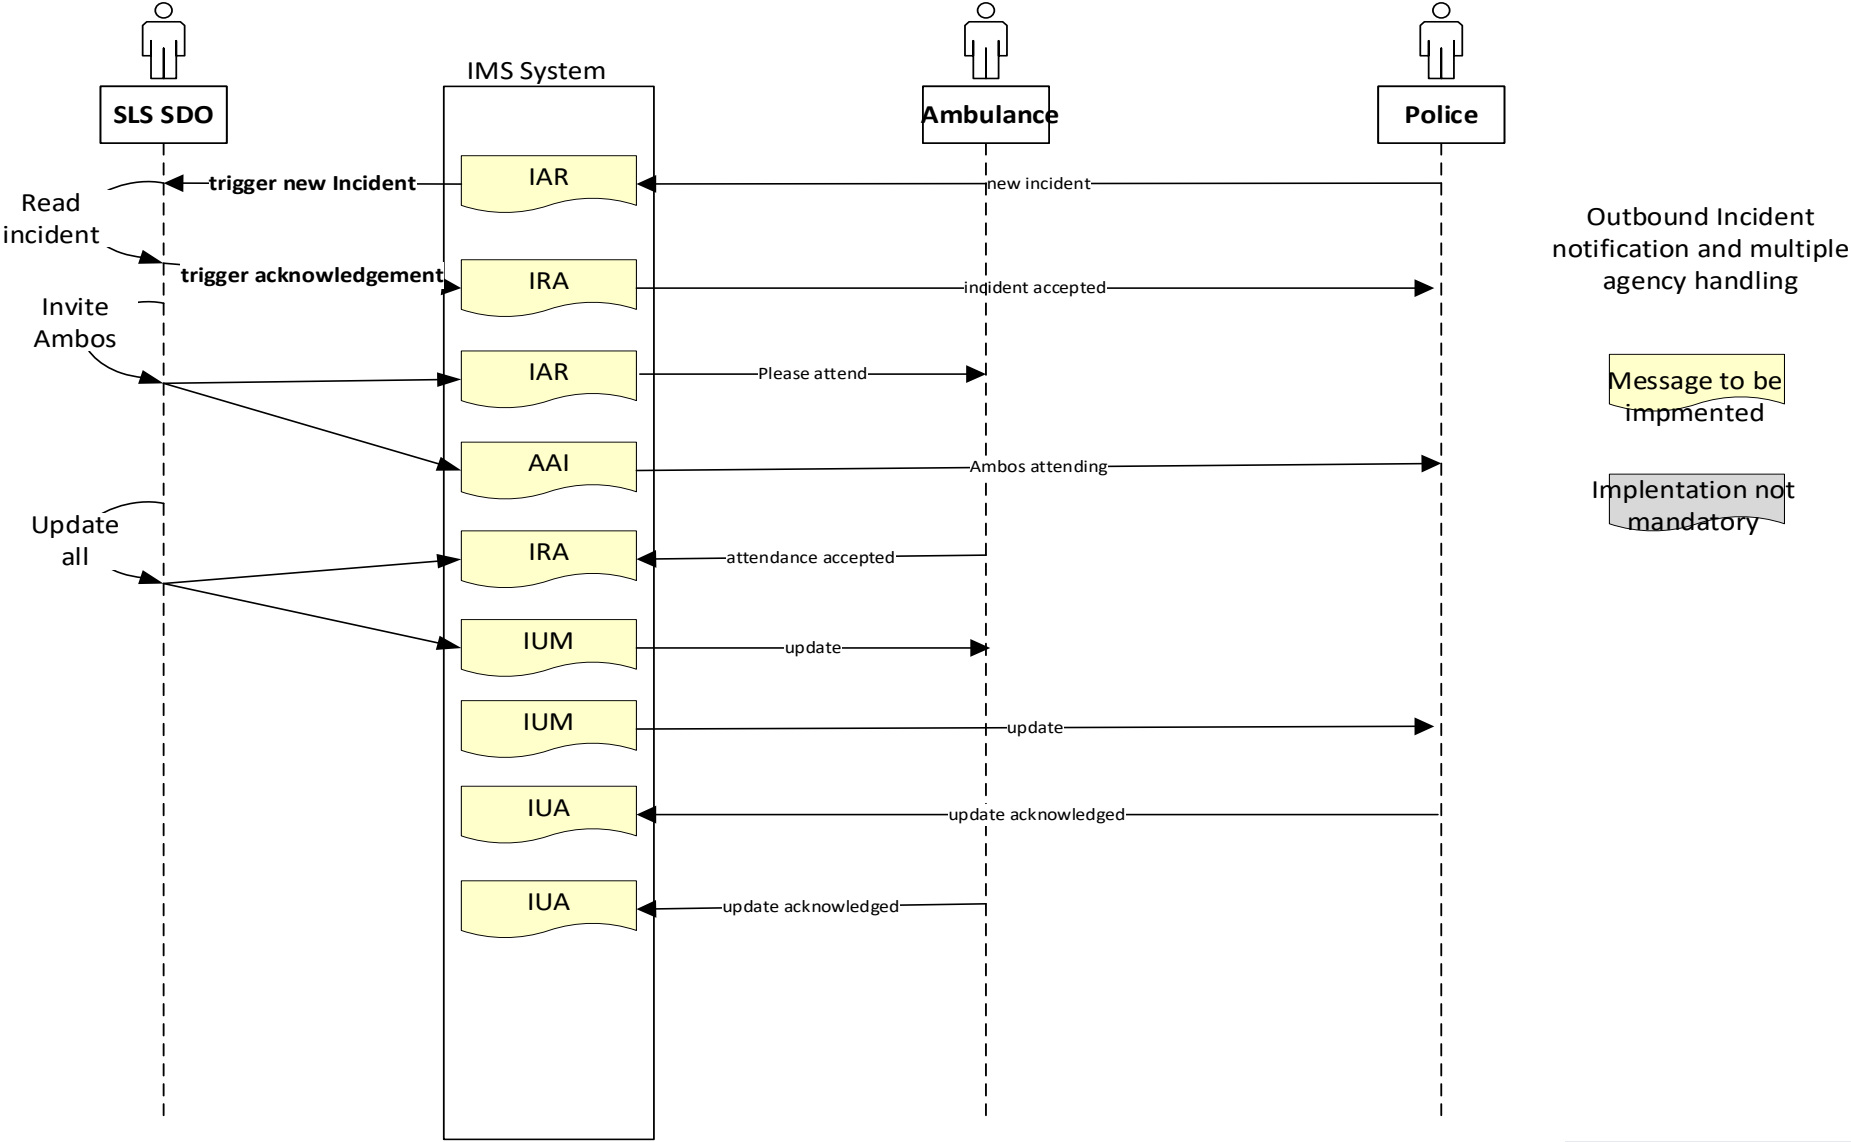

Solution Architecture

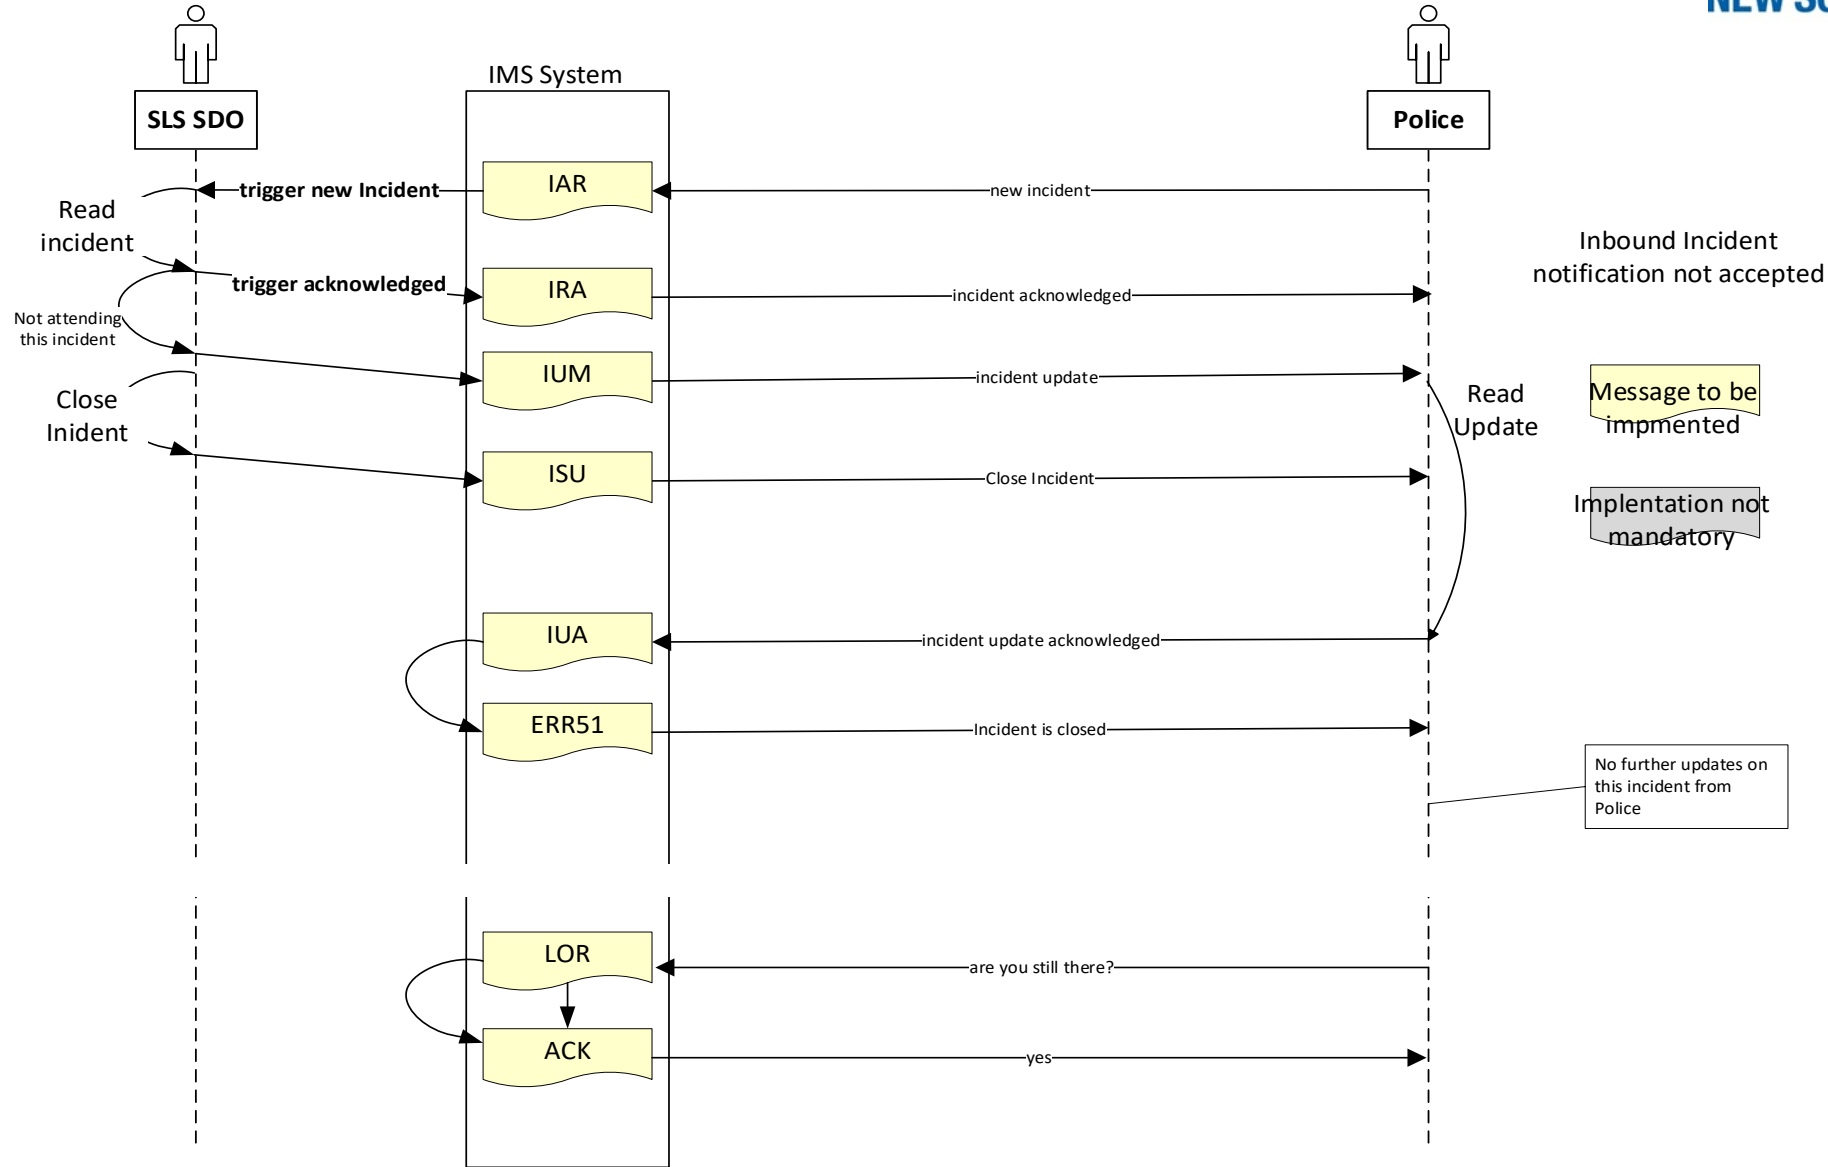

Incoming Incident

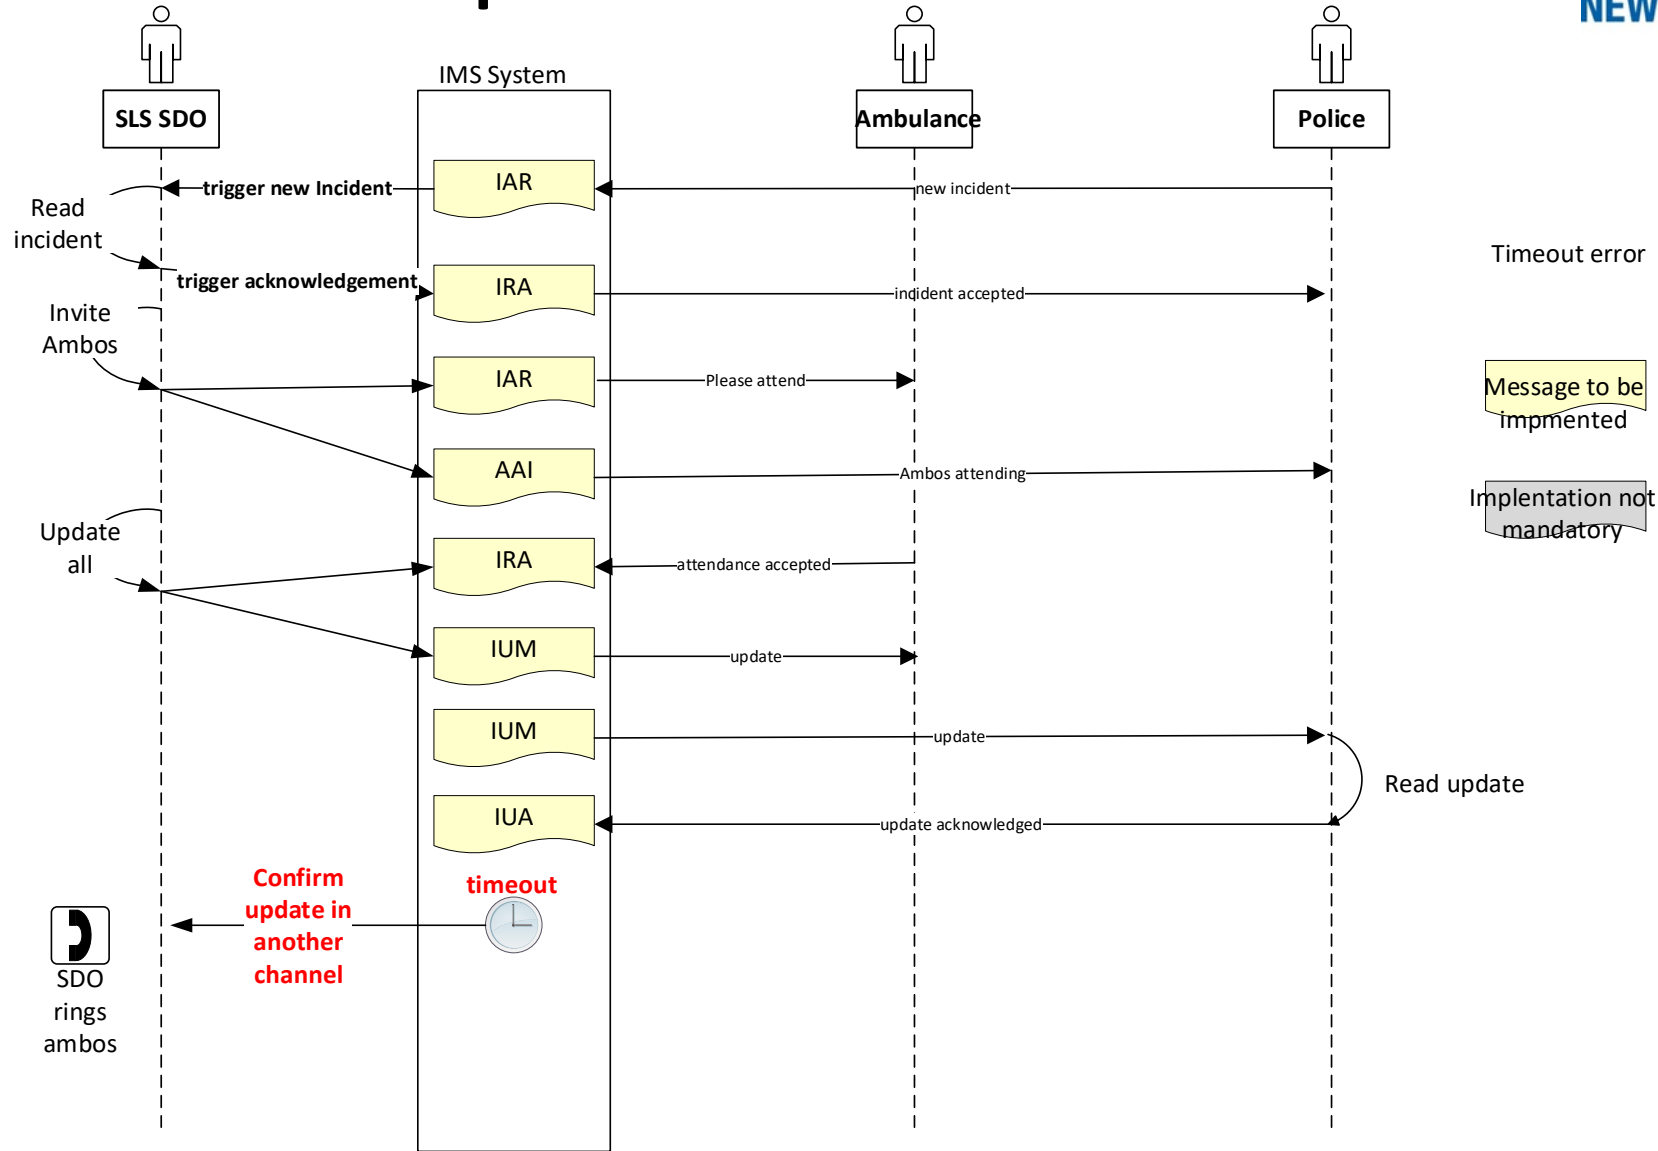

Adding an Agency

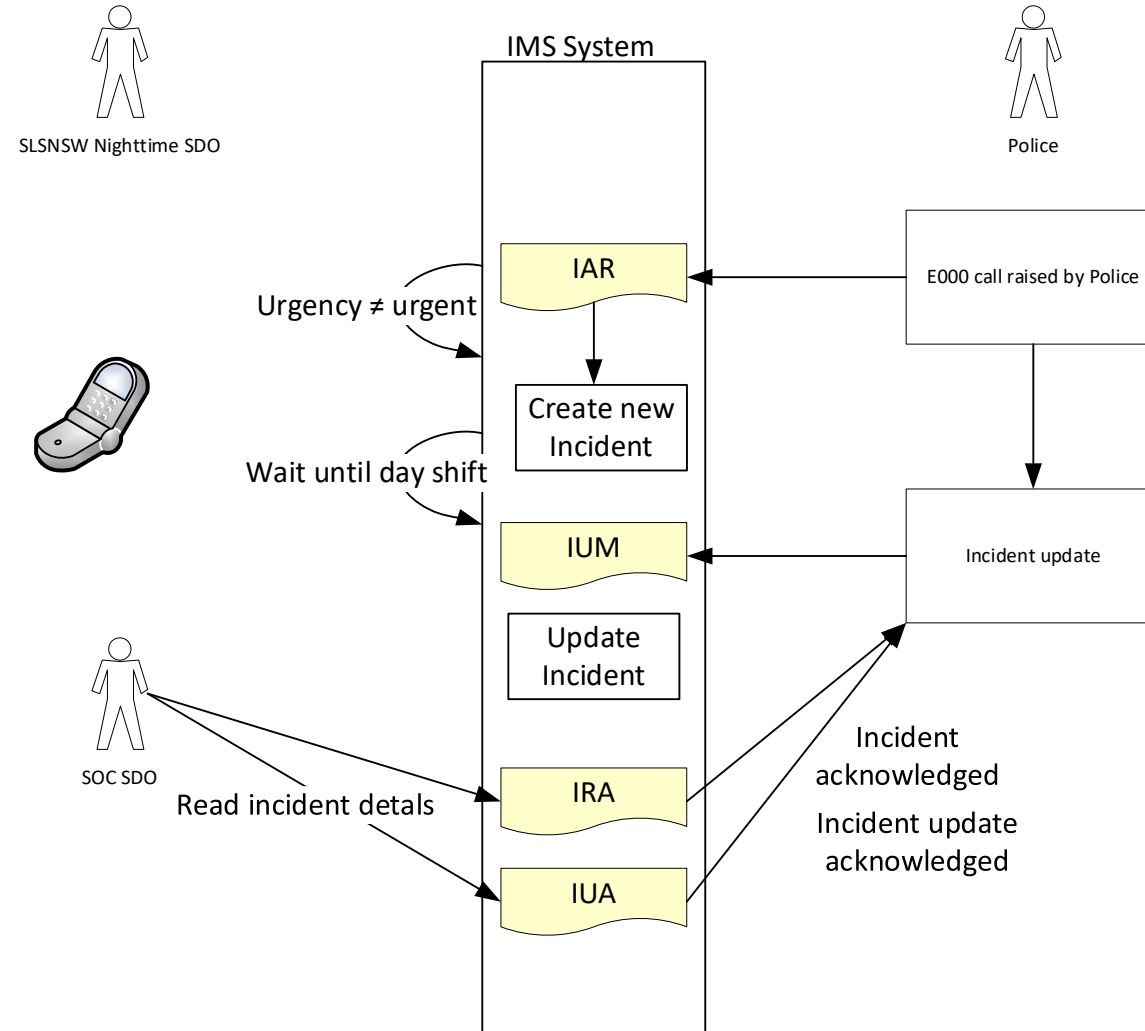

Declining an Incident

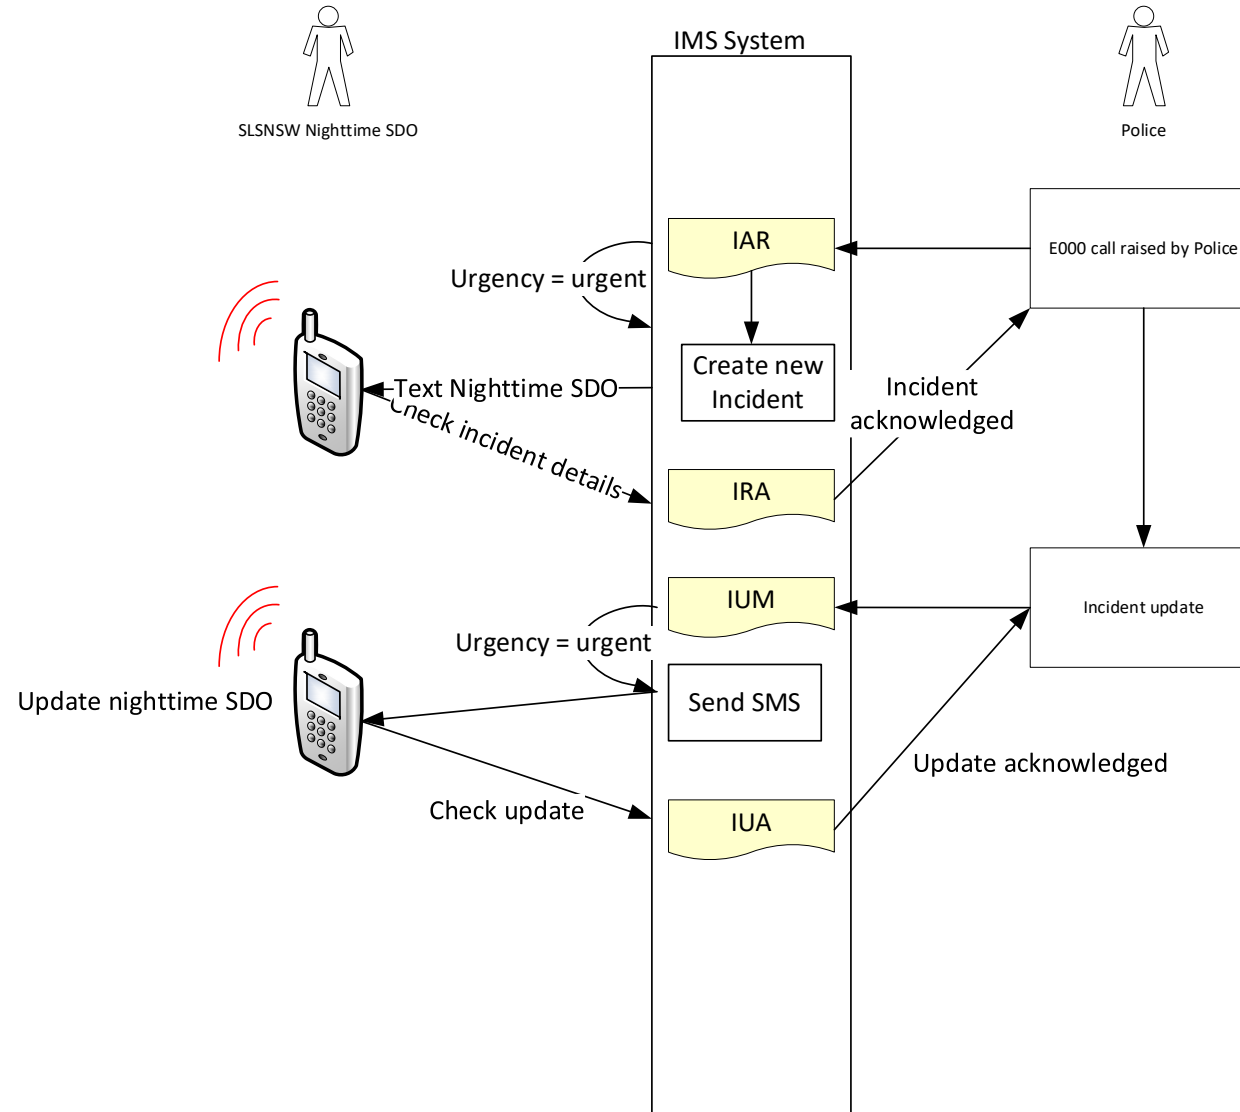

Timed-out Response

Issue – SLS SOC is unmanned at night Non-urgent incidents

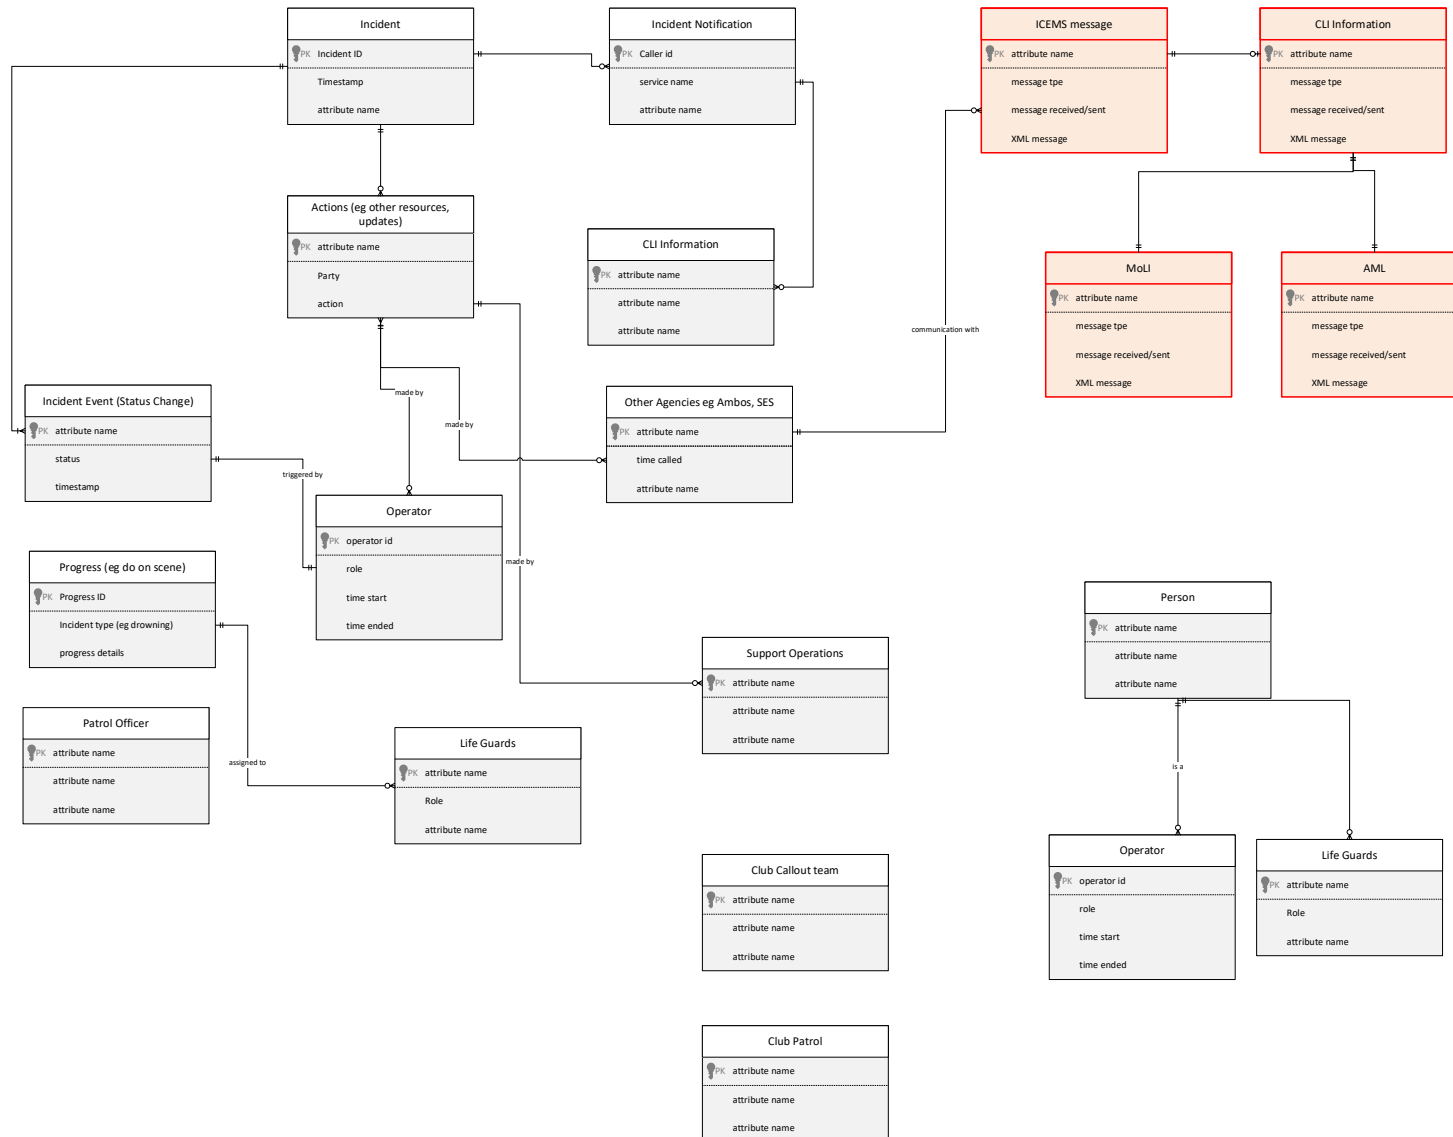

Issue – SLS SOC is unmanned at night Urgent Incidents

**SURF LIFE SAVING
NEW SOUTH WALES**

Data Model

Time Out Configuration

Timer	Range	Example/Notes	SLSNSW Config
ACK timeout	10sec to 60sec	Awaiting the associated ACK in response to a message being sent. This applies to all messages associated with the agency	This is automatic and can be handled by the ICEMS Connection Handler component
Op Accept timeout	10 sec to 24hr	Awaiting the associated IRA Operational Acceptance message following the sending of an IAR	This should be set so that incidents do not timeout while the SOC is unmanned at night. Maybe make this 15 hours.
Urgent Op Accept timeout	10sec to 60min	Awaiting the associated IRA Operational Acceptance message following the sending of an Urgent IAR	This should probably be set at about 10 minutes.
IUM timeout	10sec to 60min	Awaiting the associated IUA message following an IUM being sent	This should be set so that updates do not timeout while the SOC is unmanned at night. Maybe make this 15 hours.
Urgent IUM timeout	10sec to 60min	Awaiting the associated IUA message following the sending of an urgent IUM	This should probably be set at about 10 minutes.
RSQ timeout	10sec to 60min	Awaiting the associated RSU message following the sending of an RSQ	There is no urgency indicator on this message so it will need to be set to align with the non-urgent IARs and IUMs.
